

Abstract

◆ *Experiment 1:*

To shift up /down the center frequency of 2500AT43A0100 by changing the land pattern with *no matching circuits* (F_o @ 2.65GHz)

◆ *Experiment 2:*

To tune down the center frequency (to 2.5GHz) of 2500AT43A0100 soldered on the initial land pattern *by matching circuits*.

Experiment 1: Land Pattern Comparison

Initial land pattern
(S_{11})

Land pattern 1
(S_{22})

Land pattern 2
(S_{33})

Initial Land Pattern → Pins 4 & 5 isolated.

Land pattern 1 → Connect pins 4 & 5 with GND

Land pattern 2 → Antenna pins 3 & 6 connected together and isolated from GND, pins 4 & 5 isolated as well

GND
Isolated

GND
Isolated

Experiment 1: Measured Result

Initial land pattern(S11)→Center frequency is 2.65GHz

Land pattern 1(S22)→Center frequency is shift down 50MHz to 2.6GHz

Land pattern 2(S33) → Center frequency shift up 60MHz to 2.71GHz

Experiment2: Land Pattern Image

Initial land pattern

Matching
circuits (next
page)

Experiment2: Return Loss & Matching circuits

2500AT43A0100 soldered on initial land pattern

2500AT43A0100 without matching circuits(S11)→Center frequency is 2.65GHz

2500AT43A0100 with matching circuits(S22)→Center frequency shift down to 2.5GHz

Experiment2: Radiation Pattern @ 2.5GHz

Far-field amplitude of XY_plane.nsi

XY-plane	Peak	Avg.
H cut	-1.39	-5.82
V cut	-8.67	-14.03
Total	-1.12	-5.11

Far-field amplitude of XZ_plane.nsi

XZ-plane	Peak	Avg.
H cut	-2.50	-6.97
V cut	-3.95	-9.52
Total	-1.63	-4.47

Far-field amplitude of YZ_plane.nsi

YZ-plane	Peak	Avg.
H cut	-3.43	-9.03
V cut	-1.46	-3.27
Total	0.56	-2.17

Summary

◆ *Experiment 1:*

The results show that the center frequency can be shifted up/down by about 50MHz by changing the antenna land pattern.

◆ *Experiment 2:*

The center frequency can also be shifted down to 2.5GHz by the matching circuit (shown as the page5).

Note: Combining experiments 1 & 2 can give the designer the desired F_0
